## Exercise 1 (6/20)

Implement the A5/1 algorithm. Suppose that, after a particular step, the values in registers are

$$X = (x_0, x_1, \dots, x_{18}) = (1100110011001100110)$$

$$Y = (y_0, y_1, \dots, y_{21}) = (1101110111011101110111)$$

$$Z = (z_0, z_1, \dots, z_{22}) = (10100011010001101000111)$$

The first keystream bit is computed with the initial values of the registers. List the next 3 keystream bits (including the first keystream bit, left first). Give the contents of X, Y, and Z after these 3 bits have been generated.

## Exercise 2 (4/20)

Suppose that SHA-1, a hash function, is used to hash a message of 5025 bits. Explain the preprocess (padding process) of the message and describe the format of the padded message before applying the compression function.

## Exercise 3 (4/20)

In RSA cryptosystem:

1. Describe key generation, encryption and decryption.
2. Let the two primes  $p = 179$  and  $q = 97$  be given as set-up parameters for RSA. Which of the parameters  $e_1 = 205, e_2 = 91$  is a valid RSA exponent? Justify your choice.

3. Compute the corresponding key-pair from above valid parameters. Using this keypair to encrypt and decrypt plaintext:  $M = 8022$ .

$p, q$  are prime numbers, modulus  $N = p * q$ ,  $e$  denotes encryption exponent,  $M$  denotes the plaintext.

## Exercise 4 (6/20)

Consider the Elgamal signature scheme:

You are given Bob's private key  $K_{pr} = (d) = (127)$  and the corresponding public key  $K_{pub} = (p, \alpha, \beta) = (593, 2, \beta)$ .

1. Calculate the Elgamal signature (r,s) for a message from Bob to Alice with the following messages  $x$  and ephemeral keys  $k_E$ :

$$x = 5022, k_E = 215$$

2. Two messages  $x_1, x_2$  are received with their corresponding signatures  $(r_i, s_i)$  from Bob. Verify whether the messages  $(x_1, r_1, s_1) = (22, 227, 246)$  and  $(x_2, r_2, s_2) = (82, 227, 342)$  both originate from Bob?

3. A given Certification Authority (CA) uses Elgamal signature scheme to generate Certifications for Alice and Bob. The two IDs for them are correspondingly  $ID(A)=1$  and  $ID(B)=2$ . The CA uses the ephemeral keys  $k_E = 213$  and  $215$  for A's, and B's signatures, respectively. The numbers that are chosen at each user to generate their public keys (using Diffie-Helman Key Exchange scheme) are:

$$b_A = 2602, \quad b_B = 2022$$

To obtain the certificates, the CA computes  $x_i = 5 * b_i + ID(i)$  and uses this value as input for the signature algorithm. Compute and verify two certificates CertA and CertB.

**The End - Good Luck!**
